

John

Janice rides her bike to the park almost everyday. That park is 1200 yards from her house and she can bike there in 4 minutes. How might you represent Janice's distance from the park as she rides her bike?

1200 yards  
4 minutes

X	Y
1	300
2	600
3	900
4	1200

$$1200 \div 4 = 300?$$
$$300 \times 4 = 1200 \checkmark$$
